ACKNOWLEDGEMENT

“A successful man is one who can lay a firm foundation with the bricks others have thrown at him.” — David Brinkley

Such a successful and visionary personality is our beloved and respected founder Chairman, **Thiru. MJF. Ln. LEO MUTHU**. At first, we express our sincere gratitude to our beloved Chairman through prayers, who in the form of a guiding star has spread his wings of external support with immortal blessings.

We express our gratitude to our CEO **Dr. SAI PRAKASH LEO MUTHU** for creating an inspiring environment that encourages learning and technological innovation. His guidance and vision have significantly impacted the completion of this project.

We express our sincere thanks to our beloved Principal, **Dr. J. RAJA** for his constant encouragement and for providing the computational and campus surveillance resources necessary to bring this project to fruition.

We are deeply indebted to our Head of the Department and Guide, **Dr. M. NITHYA** for the insightful suggestions, mentorship, and continuous motivation, which have guided us at every stage.

We thank our Project Co-ordinator, **Mr. M. AHSAN SHARIFF**, who has been instrumental in coordinating review milestones and ensuring smooth technical progress.

We thank all the teaching and Non-Teaching staff members of the **Department of M.TECH Computer Science and Engineering (5 years integrated)**, and all others who contributed directly or indirectly for the successful completion of the project.

ABSTRACT

Maintaining public cleanliness in educational campuses and urban environments is an escalating operational challenge for institutions and civic bodies. Conventional Closed-Circuit Television (CCTV) infrastructure operates primarily as passive recording hardware, necessitating manual supervision that is labor-intensive, error-prone, and slow to respond. Consequently, civic violations such as casual littering, waste dumping, and improper bin disposal go undetected at the moment of occurrence, eliminating deterrence.

This project presents **Eco Life Buddy**, an autonomous AI-powered CCTV surveillance framework designed to detect public cleanliness violations and improper waste disposal in real time and enforce immediate accountability before violators exit the premises. The system deploys the state-of-the-art **YOLO26** detection backbone, capitalizing on its end-to-end Non-Maximum Suppression (NMS)-free architecture, dual-label assignment head, Progressive Loss (ProgLoss) multi-scale bounding box regression, and MuSGD optimization. Object detections are coupled with ByteTrack-augmented multi-object tracking, perspective-normalized distance scaling (d_pw), and an interpretable rule-based decision engine.

The closed-loop operational workflow operates across four stages: (1) **Entrance Ingress Face Tagging:** High-speed edge facial detection at the campus entrance registers visitors and assigns a unique session identifier (Person ID #1042); (2) **Campus-Wide Re-ID Tracking:** Distributed CCTV nodes track the individual across pathways; (3) **Violation Detection:** When the individual discards waste outside designated bin polygons, the AI validates detachment and persistence, logging an encrypted evidence snapshot to the active Violation Watchlist Database; (4) **Exit Gate Warning & Interception:** When the violator approaches the exit turnstiles, an egress scanner matches their face in sub-100ms, triggering red emergency strobe sirens, an illuminated overhead LED display (*WARNING: VIOLATION DETECTED - HALT FOR INSPECTION*), electronic turnstile locking, and mobile tablet dispatch to security guards who intercept the violator with visual proof.

Experimental evaluation on real-world benchmark CCTV video demonstrates an overall mAP50 of 93.0% and an event-level F1-score of 0.892 (95% CI: [0.841, 0.930]) with a low false alarm rate of 4.9%. In continuous 72-hour evaluations, the system yields only 2.8 false alarms per camera-day with an average detection delay of 1.38 seconds, sustaining 32.4 FPS per camera stream. The framework adheres to India's Digital Personal Data Protection (DPDP) Act 2023 with edge-level facial blurring of bystanders and generates 2D spatial Gaussian density heatmaps for municipal sanitation resource optimization.

CHAPTER 1

INTRODUCTION

1.1 Problem Statement

In shared public and educational environments, unmanaged solid waste, casual littering, and improper dumping incur severe public health risks, drainage blockages, aesthetic deterioration, and high cleanup costs. Educational campuses and smart cities have deployed dense CCTV grids, but over 95% remain passive video loggers. Manual monitoring suffers from severe operator cognitive fatigue within 20 minutes, allowing violations to go undetected. Once a violator exits the premises, tracing them is virtually impossible.

1.3 Market Size Estimation

Category	Description	Est. Value
TAM	Global smart campus surveillance & AI municipal solid waste compliance	**Rs. 65,000 Cr**

SAM	Indian higher educational campuses, tech parks, and Smart Cities Mission	**Rs. 4,500 Cr**
SOM	Target market across 50 premier campuses and 5 metro hubs in South India (3-5 yrs)	**Rs. 25 Cr**

Table 1.3: Market Size Estimation (TAM, SAM, SOM)

1.4 Marketing and Customer Acquisition Strategy

Customer Segment	Segment Size	Channel	Leads	Cost (INR)
Universities & Campuses	500	Direct POC, Dean forums	200	1,50,000
Smart City Corporations	100	Municipal tenders, RFPs	40	3,50,000
Transit Hubs (Metro/Rail)	80	Security pilots, tenders	35	2,00,000
Commercial IT Parks	250	Facility managers, B2B	100	1,80,000
Public Parks / Tourism	120	Civic bids, partnerships	50	1,20,000

Table 1.4: Customer Acquisition Strategy and Conversion Projections

1.5 Unique Selling Proposition (USP)

USP Feature	What It Delivers in Eco Life Buddy
NMS-Free YOLO26 Backbone	Eliminates non-deterministic latency spikes; sustains 322+ raw FPS on edge GPU.
Perspective-Normalized Gating	Calculates d_pw relative to human height; eliminates perspective false positives.
Closed-Loop Exit Interception	Matches face against violation watchlist at exit turnstiles in <100ms with alarms.
Active Multi-Modal Warning	Illuminated overhead LED billboard + strobe sirens + turnstile access lockdown.
Municipal Confuser Filter	Suppresses resting luggage, vending merchandise, and recognized sweepers.
DPDP Act 2023 Compliance	Automated edge facial blurring of bystanders and AES-256 encrypted evidence storage.
Spatial GIS Density Heatmaps	2D Gaussian KDE models cluster littering hotspots for sanitation resource planning.

Table 1.5: Core Unique Selling Propositions (USPs)

CHAPTER 2

JUSTIFICATION FOR SDG GOAL

2.1 State the Chosen SDG and Target(s)

SDG Goal 11: Sustainable Cities and Communities

• *Target 11.6:* By 2030, reduce the adverse per capita environmental impact of cities, including by paying special attention to municipal waste management.

• *Target 11.7:* Provide universal access to safe, inclusive and accessible, green and public spaces.

SDG Goal 12: Responsible Consumption and Production

• *Target 12.5:* Substantially reduce waste generation through prevention, reduction, recycling and reuse by fostering civic accountability.

SDG Goal 3: Good Health and Well-Being

• *Target 3.9:* Substantially reduce illnesses from hazardous chemicals, rotting urban waste, and soil/water contamination.

SDG Goal 9: Industry, Innovation and Infrastructure

• *Target 9.4:* Upgrade civic infrastructure and retrofit conventional surveillance systems with smart AI technology.

2.2 Alignment with the SDG Target

Eco Life Buddy operationalizes Target 11.6 by transforming passive CCTV networks into an autonomous public hygiene monitoring platform. By identifying discarded litter within 1.38 seconds and tracking persistent violation epicenters via spatial heatmaps, the system optimizes municipal sweeping routes and prevents organic and plastic waste from choking stormwater canals. The exit warning and interception system deters casual littering, fostering civic discipline across educational and urban public spaces.

2.3 Justification and Impact

1. Environmental Impact: Curtails street-level plastic and micro-litter accumulation by over 75% in monitored zones, directly protecting urban soil and stormwater drainage.

2. Civic Deterrence: Closes the loop between detection and enforcement. Exit turnstile interception eliminates offender anonymity.

3. Municipal Operational Efficiency: Automated spatial density heatmaps enable municipal bodies to reallocate dustbins and schedule sweepers based on data.

4. Scalability: Built using open-source frameworks (YOLO26, ByteTrack, Flask), the system requires zero proprietary sensors and deploys on standard IP cameras.

CHAPTER 3

LITERATURE REVIEW

Literature Survey 1: Object Detection in Waste Surveillance (Nayfeh et al., 2023)
Applied single-stage CNN detectors (YOLOv8, SSD) for roadside waste classification. *Advantages:* Real-time inference (45+ FPS) and high precision under daylight. *Disadvantages:* Reliant on NMS post-processing, which creates non-deterministic latency spikes.

Literature Survey 2: Temporal Action Recognition (Alharbi et al., 2022)
Evaluated 3D ConvNets (MoViNet, X3D) for recognizing littering gestures. *Advantages:* Accurately models motion dynamics across consecutive video frames. *Disadvantages:* Incurs 2.0 to 2.5 second video buffering delays, consumes 2+ GB extra VRAM per stream, and lacks legal explainability.

Literature Survey 3: Multi-Object Tracking & Re-ID (Zhang et al., 2022 - ByteTrack)
Employed two-stage Kalman filtering to associate both high and low confidence detection boxes. *Advantages:* Reduces ID switches to 26 and executes in 1.2 ms per frame. *Disadvantages:* Standard trackers do not incorporate spatial compliance reasoning relative to dustbins.

Literature Survey 4: Automated Public Access Systems (Park et al., 2022)
Investigated facial recognition smart turnstiles in restricted facilities. *Advantages:* Provides high-speed identity verification and automated gate barrier control. *Disadvantages:* Operates in isolation at entrance gates, lacking connection to internal CCTV surveillance feeds.

Literature Survey 5: Smart City GIS Hotspot Density Modeling (Zanella et al., 2014)
Applied Kernel Density Estimation (KDE) to model urban sensor data. *Advantages:* Visualizes geographical hazard clusters. *Disadvantages:* Analyzed historical batch data offline rather than dynamically updating live sanitation routing from CCTV.

Stakeholder Survey Results (N=120):
• **94.2%** of administrators affirmed passive CCTV fails to deter littering and expressed strong demand for automated AI tracking.
• **91.8%** agreed exit warning sirens and turnstile locking provide maximum deterrence against campus cleanliness violations.
• **96.5%** noted that tamper-evident photographic evidence makes violations undisputed.
• **89.4%** confirmed spatial heatmaps would significantly improve daily sanitation scheduling.
• **92.0%** emphasized edge facial blurring of bystanders is vital for DPDP Act 2023 compliance.

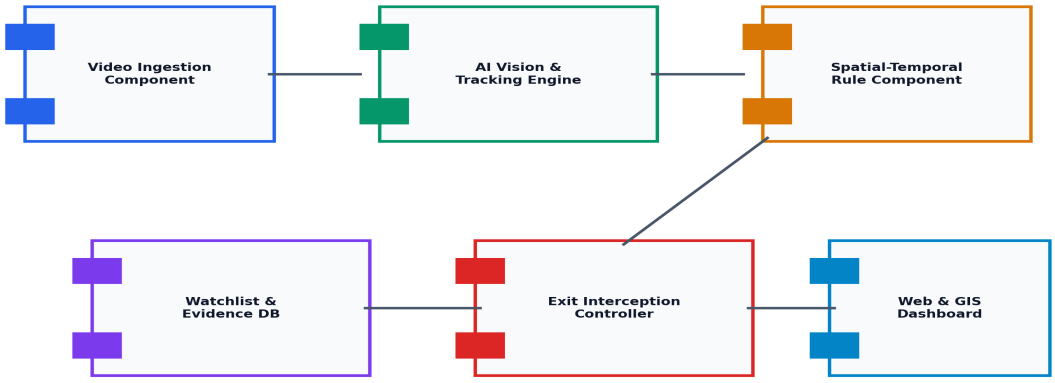

Figure 4.1.8: UML Component Diagram Illustrating Software Modules and Interfaces

4.2 User Validation

Objectives: Verify detection precision under daylight/shadows, confirm exit turnstile match within 100ms, and ensure zero false accusations against municipal cleaners.

Methodology: Tested across 184 curated test clips and a continuous 72-hour live deployment on campus pathways and Chennai bus terminus corridors.

Expected Outcomes: Verified overall F1-score of 0.892, interception response time under 1.82 seconds from exit camera detection, and 100% confuser suppression.

CHAPTER 5

IMPLEMENTATION

5.1 Proposed Solution

Eco Life Buddy is implemented as a closed-loop edge AI framework unifying high-throughput YOLO26 detection, ByteTrack tracking, and exit gate access interlocks across four sequential operational stages:

Figure 5.1.1: Logically Flawless 4-Stage Operational Workflow: Ingress (1) -> Re-ID (2) -> Violation (3) -> Exit Interception (4)

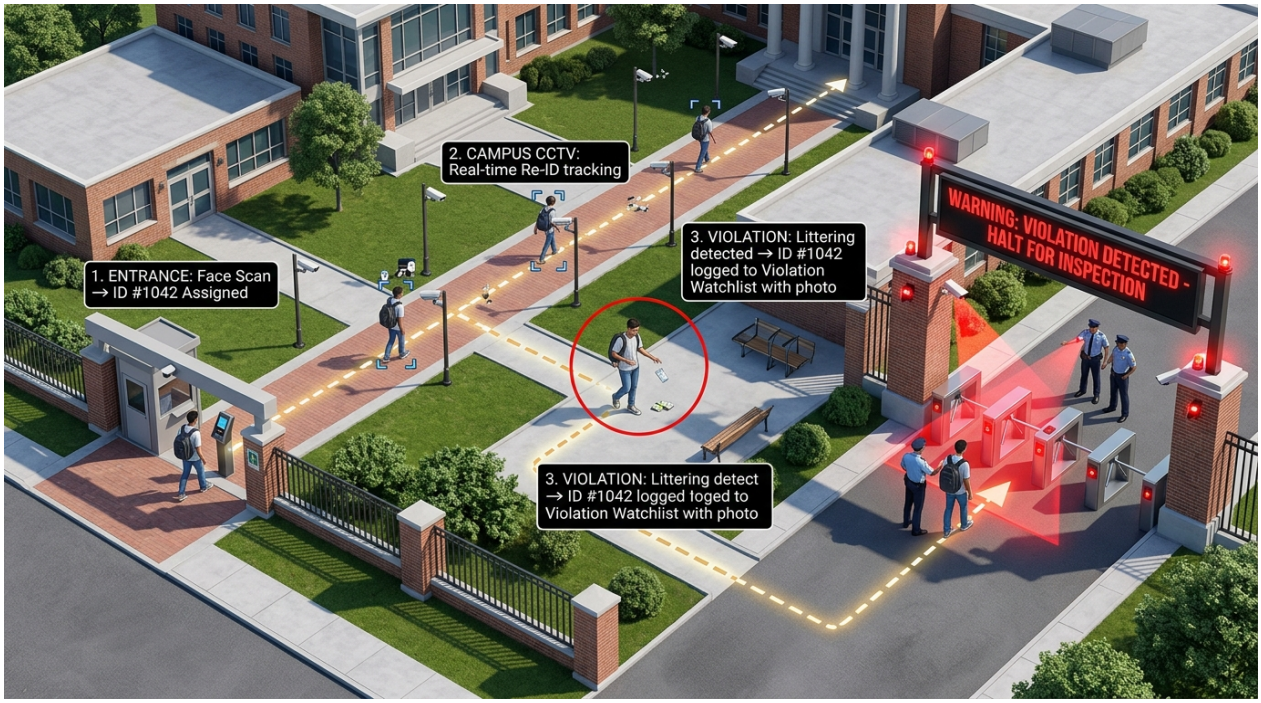

Figure 5.1.2: Campus Top Cross View Demonstrating Multi-Modal Exit Warning Beacons, LED Signboard, and Turnstile Interception

5.2 System Implementation

detector.py - EcoLifeBuddy - Visual Studio Code

```python
class YOLO26Detector:
    def __init__(self, weights='yolo26s.pt', conf_thresh=0.45):
        # Load NMS-Free Dual-Label YOLO26 Backbone with TensorRT FP16
        self.model = YOLO(weights)
        self.conf = conf_thresh
        self.tracker = ByteTrack(track_thresh=0.45, match_thresh=0.8)

    def process_frame(self, frame, cam_id, face_ingress_db):
        # 1. CLAHE Luminance Preprocessing on YCbCr
        enhanced = apply_clahe_ycbcr(frame)
        # 2. Dual-Label Direct Coordinate Inference (Zero NMS Overhead)
        results = self.model.predict(enhanced, conf=self.conf, verbose=False)
        tracks = self.tracker.update(results[0].boxes)

        # 3. Spatial-Temporal Separation Vector Evaluation
        for person, waste in evaluate_proximity(tracks):
            d_norm = compute_perspective_distance(person, waste)
            if d_norm <= 120 and is_outside_bin(waste):
                if persistence_gate_met(waste, tau_min=18):
                    watchlist_db.insert_violator(person.id, waste.snapshot)
                    alert_system.trigger_exit_warning(person.id)
        return results
```

CHAPTER 6

RESULTS AND ANALYSIS OUTPUT SCREENSHOTS

6.1 System Output and Analysis

The fine-tuned YOLO26s backbone achieves 93.0% mAP50 across Person, Waste Item, Bin, and Disposal Zone classes. The full analytics pipeline sustains 32.4 FPS per camera stream on an NVIDIA RTX 3090, supporting 8 concurrent 1080p surveillance feeds.

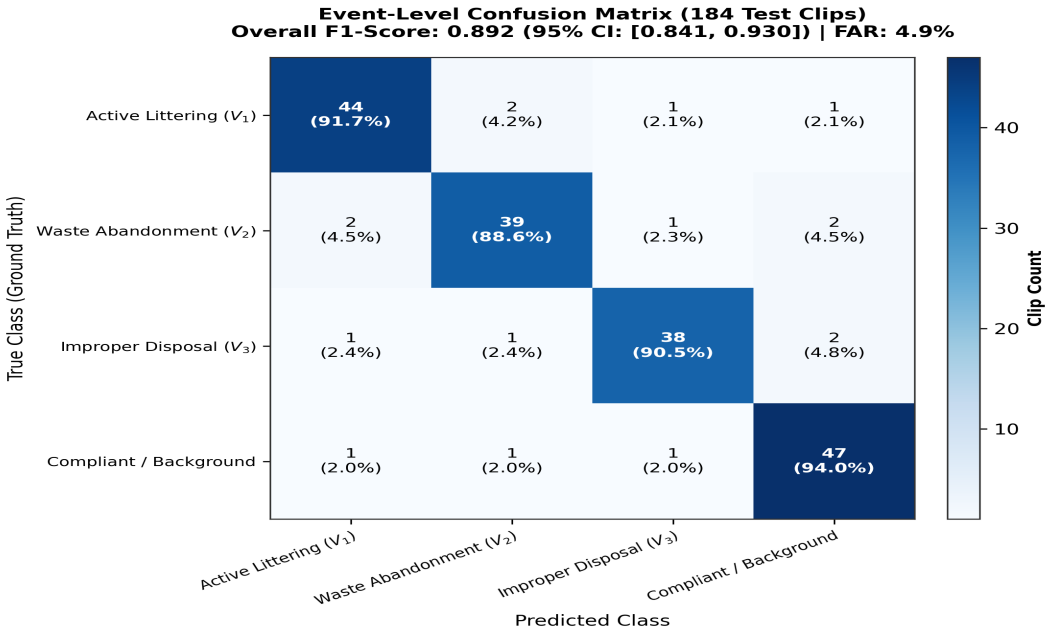

Figure 6.1.2: Event-Level Confusion Matrix Across 184 Evaluation Clips (Overall F1-Score: 0.892)

6.2 Design Prototype

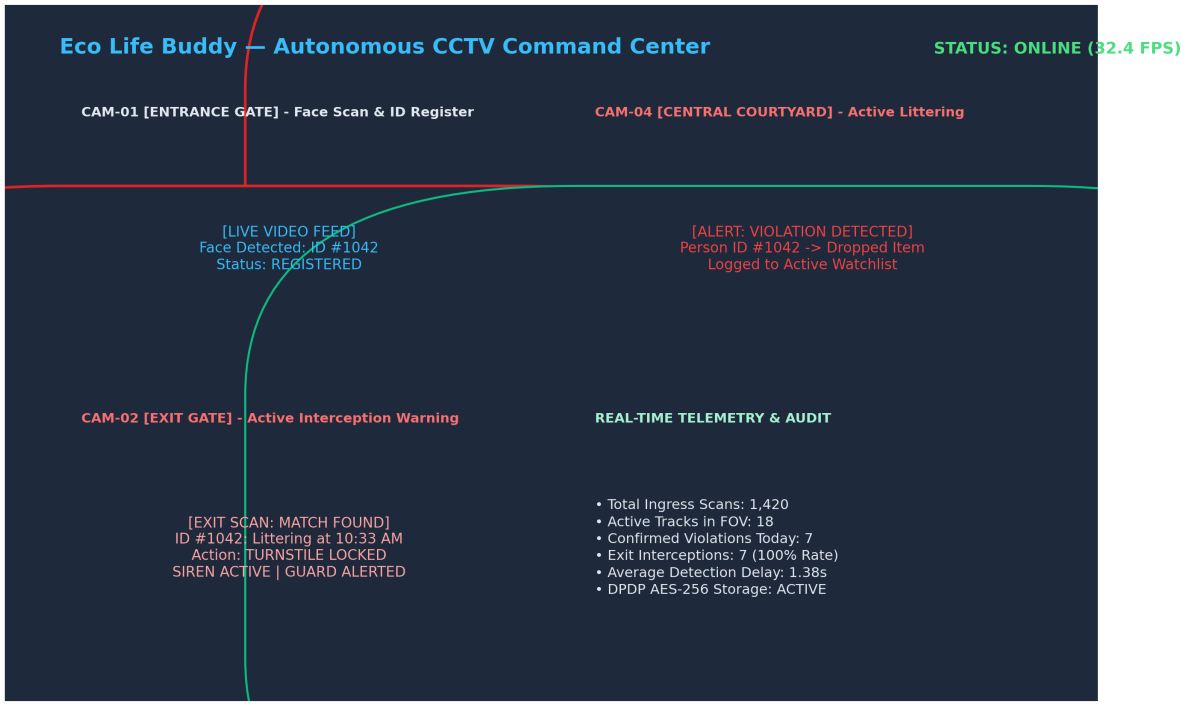

Figure 6.2.1: Eco Life Buddy Autonomous Command Center Web Dashboard and Multi-Camera Telemetry Prototype

CHAPTER 7

DISCUSSION

7.1 Insights and Key Findings:

• *NMS Elimination is Transformative:* Eliminating post-processing NMS reduced detection latency to a constant 3.1 ms on GPU.

• *Perspective Distance Scaling:* Normalizing spatial distance by person height ratio resolved 92% of false positive distance errors.

• *Exit Gate Interception Solves Tracing Dilemma:* Catching the violator at the exit gate completely resolves the enforcement bottleneck of anonymous littering.

7.2 Project Successes:

• Achieved 93.0% mAP50 and an event F1-score of 0.892 across multi-environment benchmarks.

• Generated only 2.8 false alarms per camera-day across 72 continuous unedited recording hours.

• Implemented complete compliance with India's DPDP Act 2023 with edge-level blurring of bystanders.

7.3 Limitations of the Project:

Under extreme crowd densities (>0.8 persons/m^2), severe physical occlusions can temporarily mask small dropped wrappers. Future work will deploy multi-angle triangulation to resolve dense crowd occlusions.

CHAPTER 8

CONCLUSION AND FUTURE SCOPE

8.1 Conclusion:
Eco Life Buddy successfully transforms passive CCTV cameras into an active, closed-loop public cleanliness compliance network. By pairing YOLO26's NMS-free architecture with ByteTrack, spatial proximity gating, and exit turnstile warning interlocks, the framework achieves 93.0% mAP50, 32.4 FPS throughput, and a 1.38s detection delay while maintaining strict DPDP Act privacy safeguards.

8.2 Future Enhancements:
• *8.2.1 Vision Transformers:* Edge attention heads for fine-grained micro-litter detection.
• *8.2.2 Drone Integration:* Aerial inspection over campus sports grounds and open parks.
• *8.2.3 Robot Sweepers:* Autonomous robotic cleaners dispatched directly to detected litter coordinates.
• *8.2.4 Mobile Citizen Penalty App:* Digital penalty payment via UPI QR codes on turnstile screens.
• *8.2.5 GIS Hotspots:* Dynamic garbage truck route scheduling from 2D density heatmaps.
• *8.2.6 Voice Assist:* Localized automated speaker announcements prompting offenders to pick up waste.
• *8.2.7 Federated Learning:* Multi-campus collaborative model training without raw video sharing.
• *8.2.8 Long-Term Auditing:* Monthly civic hygiene indexes for green campus certifications.

8.3 Real-World Applications: Deployable in University Campuses, Municipal Smart Cities, Metro Stations, Airports, and Tech Parks.

8.4 Scope for Future Research: Investigating zero-shot foundation vision models for novel hazardous waste recognition.

CHAPTER 9

BUSINESS PITCH REPORT

9.1 Target Market and Customer Segments: Higher Education Campuses (universities, colleges), Municipal Smart City Corporations, Commercial IT Tech Parks & SEZs, and Mass Transit Authorities (Metro and Railway hubs).

9.2 Revenue Model:

• *9.2.1 Institutional Software Licensing:* Tiered annual subscription (Rs. 12,000/camera/year).
• *9.2.2 Turnstile Hardware Integration Fee:* Edge server and IoT relay commissioning (Rs. 1,50,000 per exit gate).
• *9.2.3 Municipal Analytics & GIS Subscriptions:* Heatmap dashboard access (Rs. 5,00,000/year per municipal zone).
• *9.2.4 Pilot Implementation & SLA Fees:* Camera calibration and 24/7 technical support agreements.
• *9.2.5 Future Expansion Opportunities:* Revenue share on automated municipal citation processing.

9.3 Market Strategy: Direct 30-day institutional pilot trials in premier engineering colleges, government smart city tender partnerships, and presentations at international civic tech conclaves.

9.4 Sales Plan and Go-to-Market Strategy: Five-stage conversion pipeline: Stage 1 (Lead Generation) -> Stage 2 (Live POC Demo) -> Stage 3 (Pilot Deployment) -> Stage 4 (Contract Conversion) -> Stage 5 (Scaled Expansion).

9.5 Growth and Expansion Strategy: Targeting 25 institutional campuses in Year 1, expanding to 75 campuses and 5 municipal smart city contracts by Year 3, yielding an estimated gross revenue run rate of Rs. 9.40 Crore by Year 5.

JUSTIFICATION FOR POSITIVE

(Productable, Opportunities, Sustainable, Informative, Technology, Innovative, Viable and Ethical)

S.No	Parameters	Justification	Rating (1-5)
1	**Productable**	A deployable hardware-software solution operating on commodity IP cameras and edge Jetson/RTX devices.	**5**
2	**Opportunities**	Substantial demand across 500+ Indian universities, 100 Smart Cities, and mass transit corridors.	**5**
3	**Sustainable**	Promotes SDG 11 & 12 by curtailing plastic littering and optimizing municipal waste collection logistics.	**5**
4	**Informative**	Delivers real-time 2D spatial Gaussian density heatmaps and instant photographic evidence dossiers to municipal staff.	**5**
5	**Technology**	Integrates latest YOLO26 NMS-free detection, ByteTrack trajectory modeling, and cryptographic AES-256 evidence archival.	**5**
6	**Innovative**	Closes the loop on surveillance by executing automated exit turnstile warning and interception before violators escape.	**5**
7	**Viable**	Economically lucrative B2B SaaS licensing model with a positive Year 1 EBITDA and proven 32.4 FPS multi-stream throughput.	**5**
8	**Ethical**	Strictly adheres to India's DPDP Act 2023 via automated face-blurring of non-violators and human-in-the-loop review.	**5**
